

#### **PFAS**

# Practical experiences on soil investigation and remediation from a site in Amsterdam

Paul Verhaagen www.hmvt.eu

#### Introduction

#### Paul Verhaagen

- 30 years experience working as senior consultant and contractor
- Projects in Belgium, The Netherlands, Germany, France, Sweden, Denmark, Japan

#### HMVT

- Over 30 years experience in environmental engineering, from the start focus on innovative technologies
- Main activities are related to in-situ soil remediation, water treatment, vapour treatment
- Projects in Belgium, The Netherlands, France and Germany

## **Amsterdam project (2016 – 2019)**

- Historical use of the site
- Soil investigation PFAS (2016-2017)
- Definition of remediation targets and remediation approach (2017)
- Remediation (2018-2019)
- Lessons learned future outlook for PFAS remediation

# Historical background and use of the site

- Former marshland in the eastern part of Amsterdam
- First industrial use (timber yard) start in 1925
- Later: processing asbestos materials (1934-1970)
- 1970-2016. Fire protection materials
- 2016. End of industrial activities redevelopment

Now: development into a residential area

# Soil investigation, focus on PFAS

- Key: how was the PFAS used on the site ?
- Find the source areas of PFAS

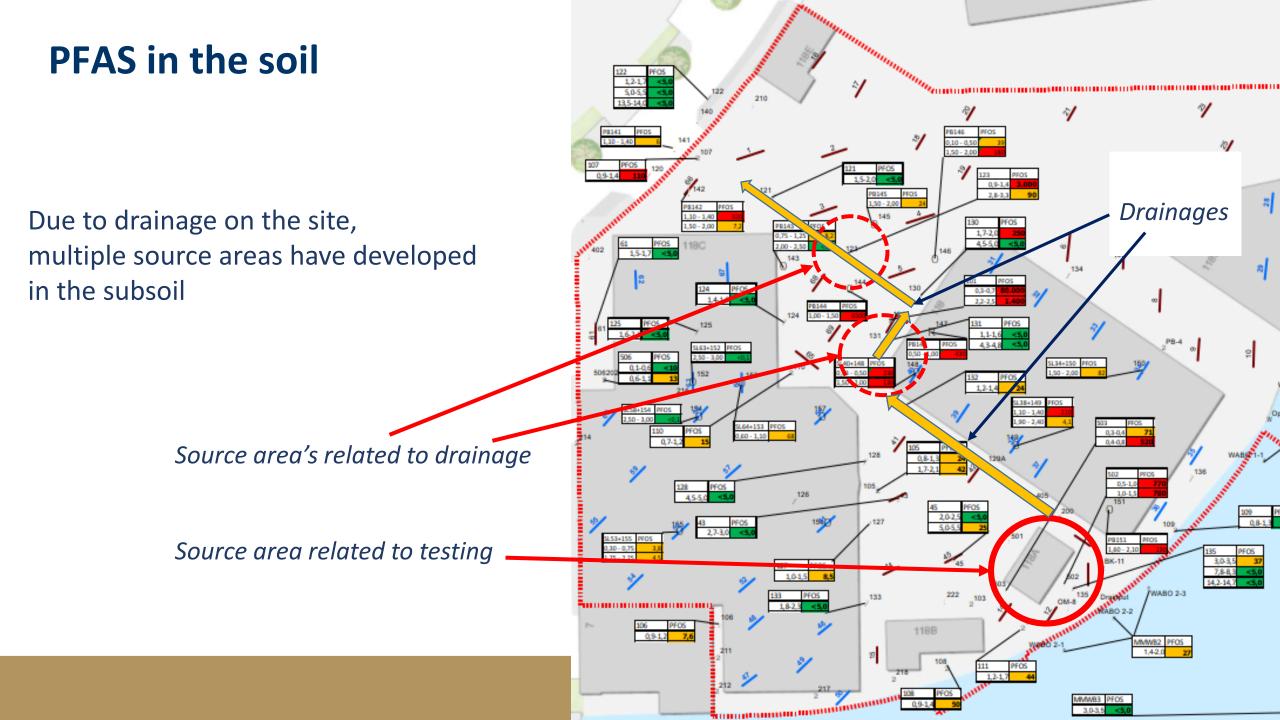

- Understand the hydrological system on the site (drainage geohydrology)
- <u>Only then:</u> start actual soil investigation
- Always look into the impact on water (groundwater/ nearby surface waters)
- Do not jump to conclusions after a few analyses

## **Soil investigation PFAS some results**

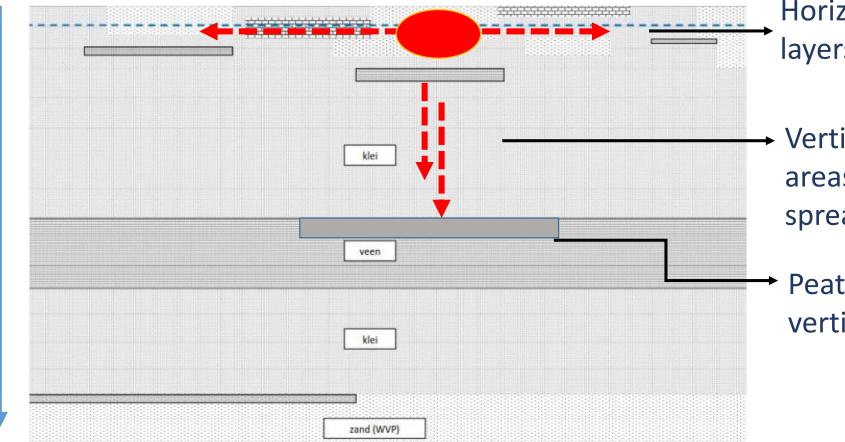

- PFAS on the site consisted for more than >90% of PFOS
- If PFAS are found: both soil + groundwater contain PFAS. Exception: in coarse sand layers only groundwater was impacted.
- Maximum levels in soil samples PFOS: 3.000 mg/kg
- Maximum levels groundwater PFOS: 6.500 μg/l
- The results confirm that hydrological system governs the spreading of PFAS into the soil

## Impact soil structure on PFAS spreading

#### infiltration

Horizontal spreading (via rubble layers, via drainage etc.)

- Vertical spreading at source areas (clay no hinderance for spreading)
- Peat is a hinderance for vertical spreading

#### This is site specific

## **Definition of remediation targets PFAS**

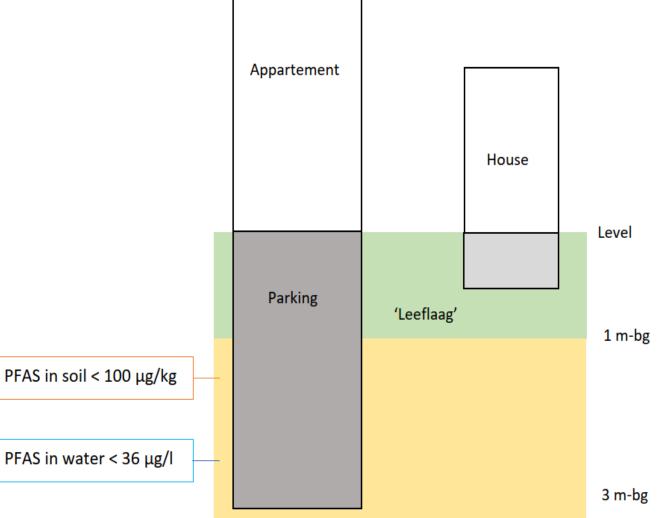

- In 2016: no set values for remediation PFAS.
- So, start with the basics: what is the aim of the remediation ? To make the redevelopment of the site possible. No remediation no redevelopment.
- Remediation target is the elimination of risks related to a contamination. So, in this case the soil remediation has to remove risks in relation to the future use of the site.
- For this site the situation after remediation:
  - No risks for humans (installing a clean layer of soil –'leeflaag', use of the site apartments, no private garden area's)
  - No ecological risks (clean soil layer)
  - No risk for spreading (removal of source areas)

## **Remediation targets**

2017 accepted remediation targets site: Soil 100 µg/kg Groundwater: 36 µg/l How did we get there? Soil: Use of existing values for a 'neglectable impact on surrounding soil – water quality' *Groundwater:* use of the set level for water **Emissions**.

Most important: the remediation results in the removal of 97% of the PFOS.

| Compound |                 |  |  |
|----------|-----------------|--|--|
|          | Soil<br>(µg/kg) | Groundwater (µg/l)<br>(incl. drinking water) | Groundwater (µg/l)<br>(excl. drinking water) |
| PFOS     | 110             | 0,20   | 56   |
| PFOA     | 1100            | 0,39   | 70   |
| GenX     | 97              | 0,66   | 140  |
|          |                 |  |  |

For the project in 2017: 100  $\mu$ g/kg

For the project in 2017: 36  $\mu g/l$ 

# **Remediation of PFAS**

- > Safety issues for staff during remediation PFAS are basic.
- > **PFAS analyses**: please consider in advance the required lab time
- > The **technologies** for the remediation at this project were basic:
- Excavation of contaminated soil
- Extraction of contaminated groundwater
- > **Treatment** (soil and groundwater) are <u>very</u> complex:
- Treatment / final disposal of soil
- Treatment purification of the groundwater

#### **Treatment of PFAS contaminated groundwater**

Water treatment applied at the site in Amsterdam

Future outlook remediation technologies

#### **Pilot treatment PFAS**

#### **PFAS water treatment conclusions**

Experiences with the selected approach and the technology:

- Emission requirement PFAS 1 µg/l is achievable
- Buffering (water silo) is important to homogenize PFAS levels
- Removal of suspended material from the water is essential

#### **Future outlook on PFAS remediation**

#### > Water

#### **PFAS remediation soil**

No (in-situ) remediation technologies for soil treatment available.

In-situ remediation: next 1-3 years no expectations on a breakthrough of a (economical) technology. Bottlenecks:

- Properties PFAS (behaviour in soil)
- Remediation targets required (and potential for reuse of soil)

Treatment of soil (ex-situ). Good option can be washing of (sandy) soils followed by treatment of waste water from the plant.

#### **PFAS remediation water**

By 2021 various treatment technologies are available.

Selection of water treatment technologies are always site specific:

- Short remediation time / small flow / low levels: GAC
- Longer remediation time higher flow / higher levels: combination of technologies

Key issue is to prevent waste generated (GAC, others) that has to be incinerated or landfilled.

## Thank you
